Website Traffic Baseline:

The website got 1,554 sessions for the month of June 2021. (GA Installed June 15, 2021)

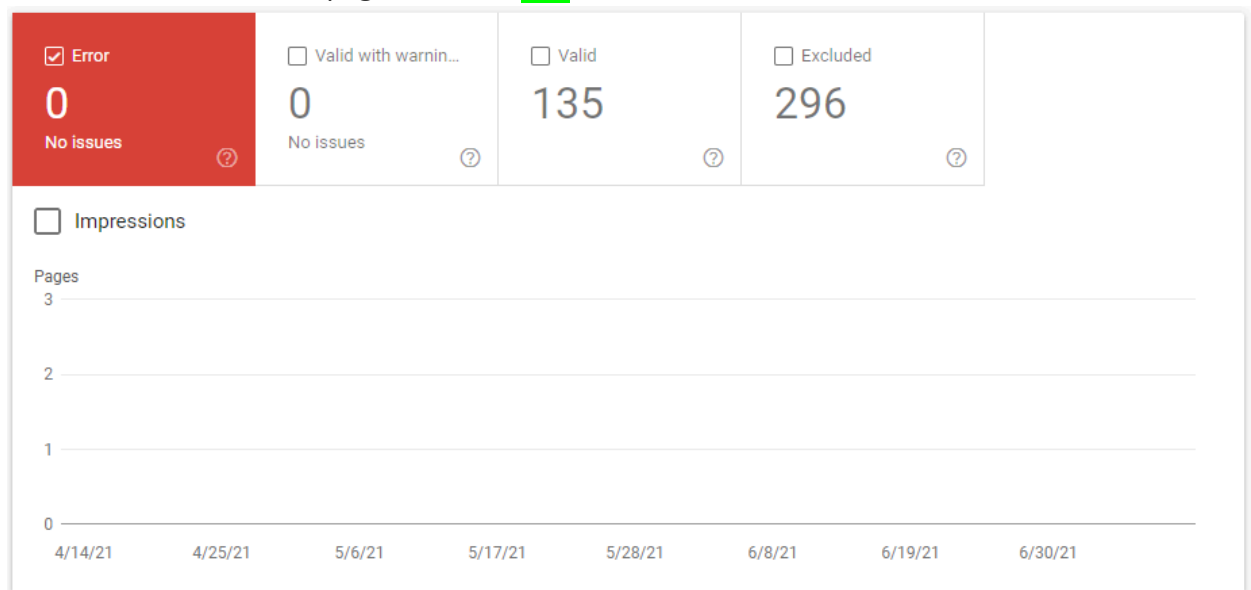

Keyword Ranking Baseline:

Keyword	Ranking
Mesa, AZ windows	Ranked 1 st in organic and 2 nd in 3 pack
windows Mesa, AZ	Ranked 1 st in organic and 2 nd in 3 pack
Mesa windows	Ranked 1 st in organic and 3 rd in 3 pack

Index

1. Number of indexed pages

- Total number of indexed pages via GSC: 135

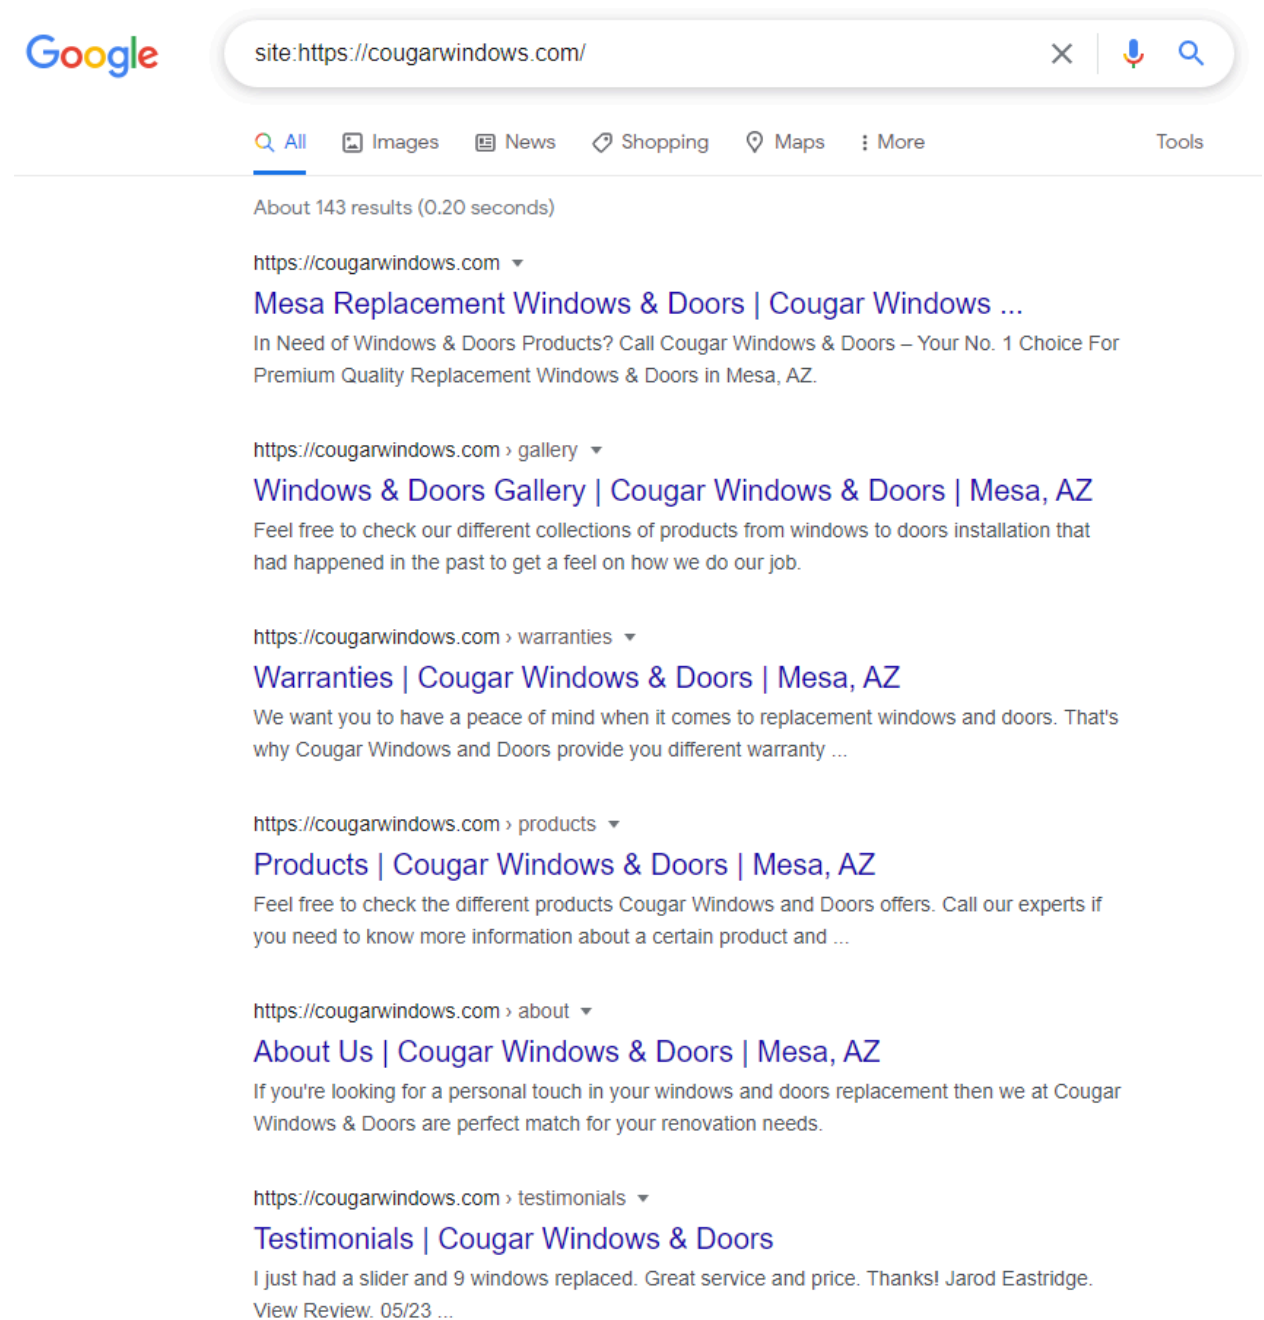

This shows how many total URLs are available for display in the Google search index.

In the Excluded section of the Coverage Report, you can see the number of URLs that Google is aware of, but is not displaying in search results because there is a problem of some sort.

You can dig deeper into the data by clicking each line to see more details on why URLs were excluded for more information.

- The second most accurate method is to do a **site:www.yourdomain.com** search at Google. The value between what Google Search Console reports, and the number of results reported back from **site:www.yourdomain.com** searches will vary, sometimes greatly.

About 143 results

The screenshot shows a Google search interface. The search bar contains the text 'site:https://cougarwindows.com/'. Below the search bar, there are tabs for 'All', 'Images', 'News', 'Shopping', 'Maps', and 'More'. The 'All' tab is selected. Below the tabs, it says 'About 143 results (0.20 seconds)'. The search results are listed below, each with a URL, a title, and a snippet of text.

Google

site:https://cougarwindows.com/

I just had a slider and 9 windows replaced. Great service and price. Thanks! Jarod Eastridge. View Review. 05/23 ...

2. Review # of indexed images

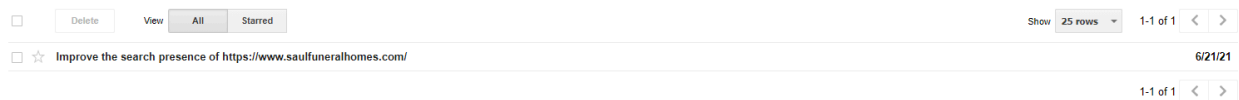

- Do a **site:domain.com** search in Google Image Search

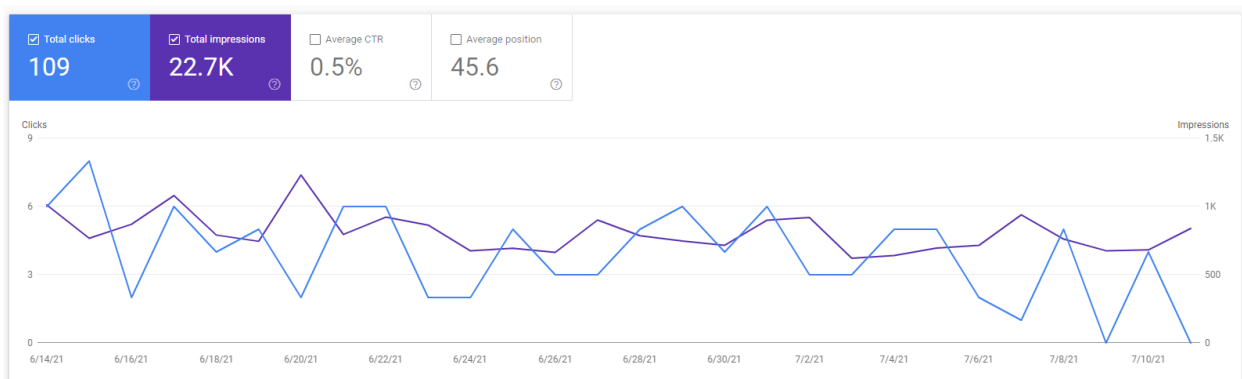

3. Review Webmaster Data from Google

- Review any site message reports.

Messages

- If your site makes use of structured data you should see their different classes in Enhancements (but not all). No Enhancement Data
- Google Search Console **Performance** Reporting is very important area with a lot of data to show you how your site is doing in Google Search.

Below the charting you'll see that you can get data on search queries, what pages are getting Clicks & Impressions, the locations of your visitors, CTR, Average Position and more.

- Review Google Search Console **Security & Manual Actions** - hopefully you have no problems in this section, if so you'll have to take appropriate actions. No Security and Manual Actions.

Any Manual Action Penalties will have to be reviewed, typically your site should not have any penalties.

International Targeting

Language Country

✓ Target users in: United States

✓ Saving changes

Learn more

Dismiss

- The Legacy Tools & Reports section should be fully reviewed for previous settings and information, for example check the **International Targeting** to see if it is set correctly (Google will likely remove these legacy sections in the future). **Targeting United States.**

Are there any URLs set to be removed in the **Removals** Section? **No URL Removal Requests**

4. Check Cached Content for important pages

- How recent are the cached dates? Important and frequently updated pages should be crawled frequently.
- Are there additional links showing in the cache that aren't showing when you look at the same URL in a browser? That may be a sign of Malware or that the server has been compromised. You may want to use the **View Source** option to look at the actual page code.

This is Google's cache of <https://cougarwindows.com/>. It is a snapshot of the page as it appeared on 12 Jul 2021 04:27:05 GMT.

[Full version](#) [Text-only version](#) [View source](#)

5. Check 404 Error Handler

- If you request a nonsense page from the site such as <https://www.domain.com/blablahbla> does the site return a 404 Error Response Page? **Yes**

6. Review robots.txt and .htaccess files

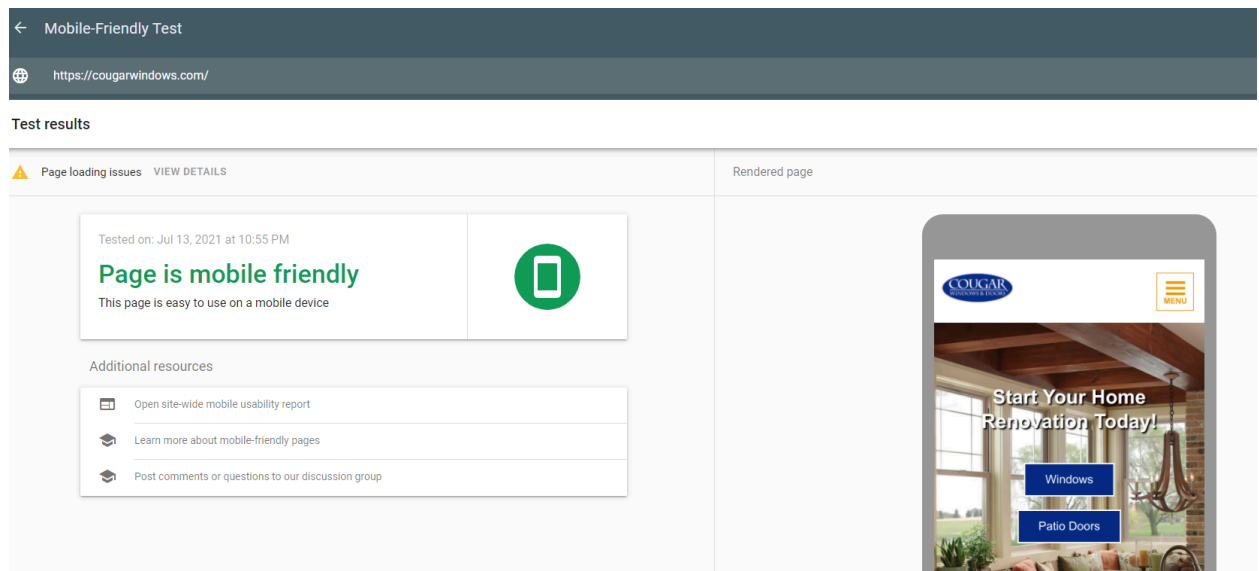

- Load <http://domain.com/robots.txt> in your browser to view it. What URLs are blocked in robots.txt? URLs blocked in robots.txt can't transfer page rank.

robots.txt found in website

```
User-agent: *
Disallow: /wp-admin/
Allow: /wp-admin/admin-ajax.php

Sitemap: https://cougarwindows.com/sitemap.xml
```

- Verify no URLs necessary to render the page are included in robots.txt such as images, CSS and JavaScript. You can use the Google Search Console's [Mobile Friendly Test](#) service to verify an individual URL's access to everything it needs to render the page fully.

- What URLs should be blocked, but aren't in robots.txt? **None**
- Is there content that is blocked in robots.txt that shouldn't be? **No**
- Are there settings in robots.txt that can be removed? **No**
- Are there 301 redirects, or other commands in the .htaccess file that can be removed? **none**

7. Review XML Sitemaps

- If [XML sitemaps](#) are used, are they correct and kept up to date? When were they last updated? **None**

Submitted sitemaps						
Sitemap	Type	Submitted ↓	Last read	Status	Discovered URLs	
Rows per page: 10 ▼ 0-0 of 0 < >						

- Check to make sure you're not generating sitemaps for content you don't want indexed and/or have set to **meta noindex**. For example image attachment sitemaps, slider sitemaps, category, tag or special feature sitemaps. **No issues found**
- If there is video hosted on the site, is an XML Video Sitemap used? **No video sitemap**
- Are XML Image Sitemaps used? **No image sitemap**

8. Does the site have an *indexable navigation system*?

- Is JavaScript or Flash based technology used for the menu or other navigation links? **No, site's navigation is html and text-based**
- If you're not sure, turn JavaScript and CSS off in your browser, can you still use the links? If so, you're good to go. **Yes, links are crawlable and clickable**

Site Architecture

1. Click Depth

- How many clicks is the majority of the important content from the home page?

3 clicks on header navigation buttons

- What's the maximum depth of content in clicks from the home page?

3 clicks

2. Content Structure

- How many categories are there? 7 categories in header and no in footer
- How many sub-categories are there? 8 sub-categories

3. Navigation

How many links are there in the main navigation? There are 29 links found on the website (amount of links not excessive)

- Are there over 100 links on upper-level pages? Over 100 is excessive and is likely spreading available Link Juice too thin. No

4. Link Anchor Text Structure

- Does the site utilize reasonable keywords in *internal link anchor text*? Yes
- Excessive repetition of primary keyword in navigation structure can trigger a penalty or reduced ranking. Not Excessive

5. Are Mobile Redirects working correctly?

- If the site customizes content for mobile devices, or redirects users to a m.domain.com site, verify the redirects are working correctly. Desktop site subpages should NOT redirect to the m.domain.com site's home page. Desktop sites should not redirect to 404 error pages on m.domain.com sites either. No Redirects
- If a desktop user lands on the desktop site, can they navigate (or be redirected) successfully to the mobile equivalent? No mobile equivalent
- If a desktop user lands on the mobile site, can they navigate successfully to the desktop page equivalent? No mobile version
- Does the site redirect Tablet users to a mobile site? That might not be the best solution if the desktop site works well for tablets. No mobile version

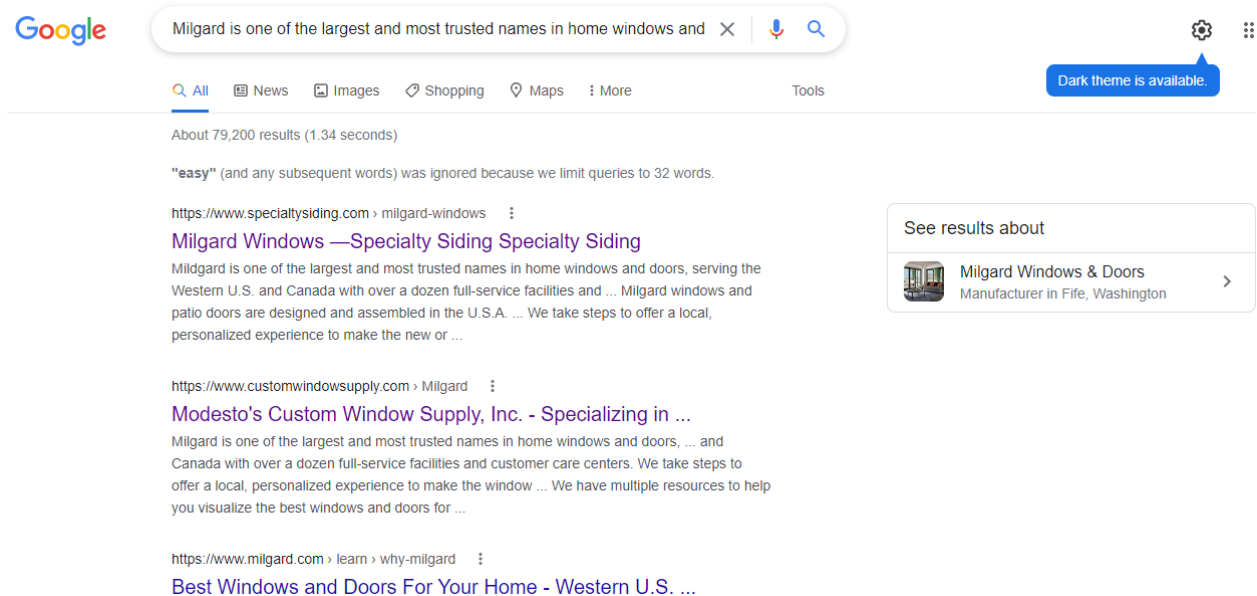

6. Search Engine Friendly URLs

- Does the site utilize excessive URL parameters and/or session IDs? These can cause crawling and duplicate content problems. **Uses URL Parameters**

Duplicate Content

1. Check for off-site duplicate content problems

- Search for a unique snippet of text within quotes from recent, but not brand new content – does it show up anywhere else? **Duplicate Found**

- If there are copies of content, attempt to determine the source. For example, are they scrapping the site? RSS feed? Content Syndication? **No**
- How about images, are the site's images copied to other websites? **Some stock images found as duplicate.**
- Conduct searches for the company's phone numbers (toll free and standard), and postal address to help discover additional websites. **No Duplicate found.**
- Has the company moved in recent years? Conduct Searches for previous phone and address references if so. **No**

2. Are both the www and non-www versions of the site indexed?

- Check using the **site:domain.com** search command. Look for both www and non-www, or other variations of subdomain names listed. **https://www. version only**

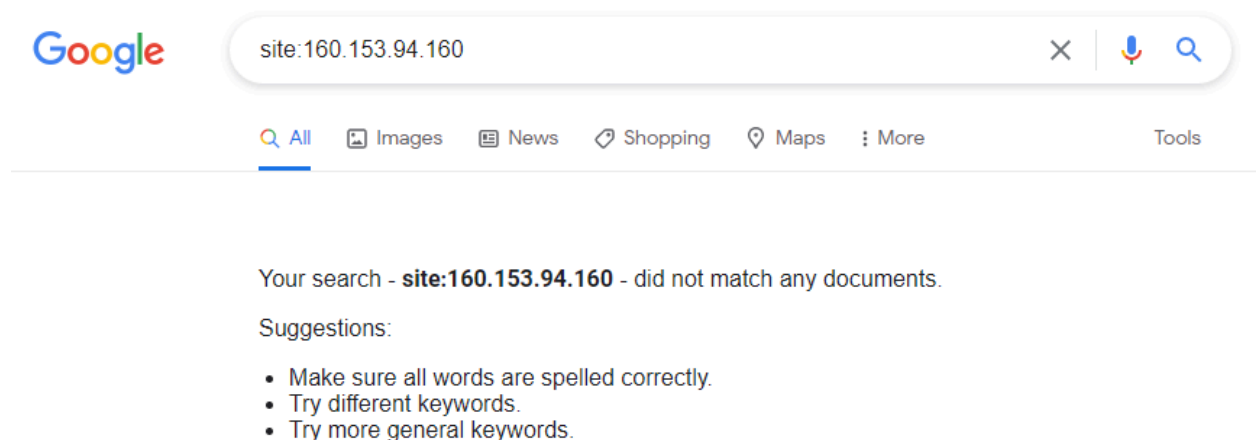

3. Is the site indexed by IP address or by host name?

- Find the site's IP address using a tool like - [whatismyipaddress.com's Hostname IP Finder](https://whatismyipaddress.com).

Lookup IPv4 Address: 160.153.94.160

- Do a search at Google using the site search operator, example **site:74.125.224.68**

Duplicate not found.

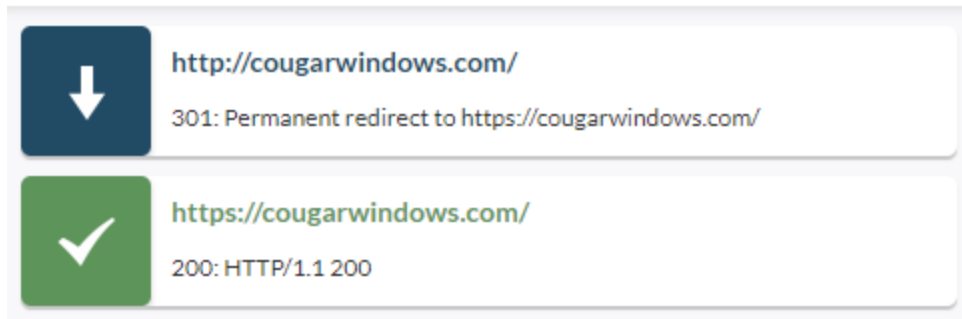

4. Is there a duplicate issue with mobile content?

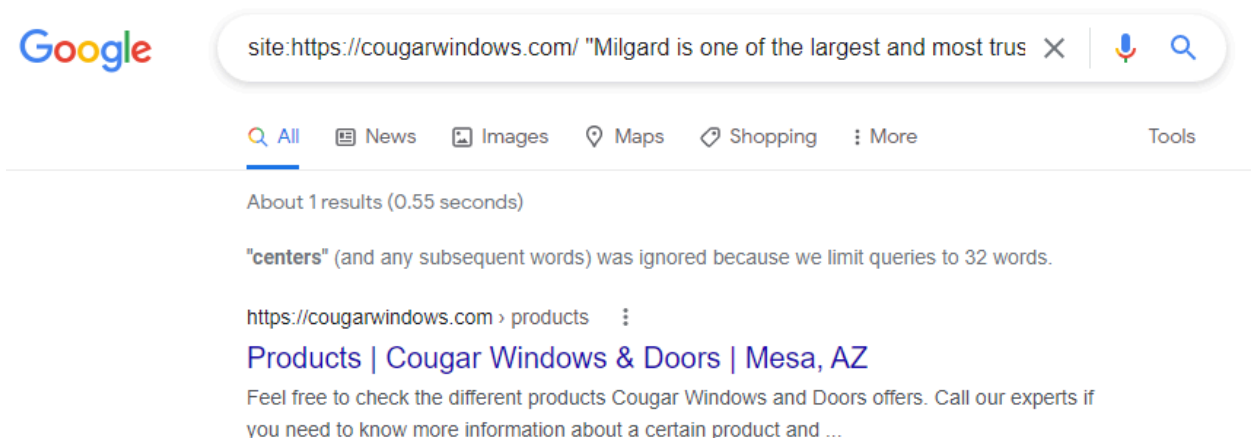

If a mobile site or mobile customization occurs for mobile, does that create a duplicate content situation on site, or on a m.domain.com mobile site? Is there a **rel=canonical tag** in place to address this problem? **No mobile version of the website.**

5. Are there 301 redirects in place to the preferred (www or non-www) canonical version?

- Check using the Varvy [Redirect Mapper](#) to be sure the site is using the proper 301 redirect and not a 302 redirect. **301 redirects**

6. Is the site a dynamic database driven site, or does it use tracking URLs?

URL variables and tracking URL's can often cause content to be indexed multiple times. Take a snippet of body text from an indexed page, and then search for it using the **site:domain.com "text snippet"** method to see if you can find *alternate URL structures*.

- If the site uses URL parameters, such as `?category=shoe&brand=nike&color=red&size=5`, you might want to make use of [URL Parameters Tool](#) in Google Search Console to avoid problems with duplicate content. The use of the `rel=canonical` tag should also be used in this situation to avoid massive duplicate content. **Uses URL parameters**

7. Check for additional Domains, subdomains, subdirectories and secure servers for duplicate content.

- Does the same content exist on different domains, subdomains, subdirectories, or secure servers (https)? **No**
- Do other domain names point to the same content on the server? Ask if the company owns other domains, get a list of any “*extra domains*” and check to see what content they are pointed at and do a **site:** search to see if they are indexed. **None**
- Are there other domains representing the company, such as YellowPages or other promotional domains representing the company at the same address? These can be a source of problems for Google My Business Page resulting in lower ranking and/or incorrect address citations. **Yes**

Content

1. Does the home page of the site have indexable text of at least one paragraph?

- Lack of indexable text can be a *severe ranking problem*.
- Rough rule of thumb, if you can hit CNTL-A then CNTL-C to copy the text on the site and paste it into a text editor, that text should be what is indexable.

Result: <https://wordcounter.net/>

Total words: 199

Keyword density: 3%

Keyword	Density
doors	11 (7%)
home	10 (7%)
today	9 (6%)
start	7 (5%)
renovation	7 (5%)
windowspatio	7 (5%)
windows	5 (3%)
cougar	4 (3%)
mesa	3 (2%)
hours	3 (2%)

- Having 1500-2500 words on the page would be ideal, but of course in certain situations that's difficult to do. At least try to have 150 words minimum for your pages - more is better.

2. Spelling, Grammar and Content Quality

- We believe a lack of spelling and grammar errors can be a small quality signal.

No grammar and punctuation errors found through Grammarly.

- Does the content read like a magazine or newspaper article, or does it read like someone paid a worker in India \$1/hr to produce? Content is okay.
- If this is an ecommerce site, is there a lack of security signals that would make you not trust them with your credit card? HTTPS

3. What is the Readability Level of Important Content ?

- Copy the plain text from the home page (Not HTML Code) and paste it into an online tool such as the 'Dale Chall Online Tester' at www.readabilityformulas.com. Record the Grade Level, # of Words NOT found in the Word List (Unique Words) and Final Score.

Your Results:

Your text: Cougar Windows provides guidance on design ideas o ...([show all text](#))

of words NOT found on Dale-Chall Word List : 13

Percent of words NOT found on Dale-Chall Word List: : 22%

([Show words NOT on the Dale-Chall Word List](#))

Dale-Chall Formula worksheet

Raw score 4.4132 [[?](#)]

Adjusted Score: (3.6365 + 4.4132) [[?](#)]

Final Score: 8 [[?](#)]

New Dale-Chall Readability Index:

Grade level: [Grades 11 - 12](#)

[[f](#)].| [[a](#)].| [[r](#)]

- Has readability been compromised for the sake of optimization? **No**

4. Does the site have over usage of important keywords?

- Is there excessive keyword repetition within the indexable body text, image alt text, and/or links? Does the content look "spammy"? **No**
- Is the site a "[Your Money or Your Life](#)" website? If so, would you trust the site with your credit card information, email address, or other personal health details? **Yes**
- Are outbound links relevant to the topic on the page? **Yes**

5. Meta Tags

- Review **Meta description** tags. Does each page have a unique, well written description? **No pages found with duplicate meta description.**
- Look for use of the **Meta robots** tag. The noindex variable should only be used on pages that indeed should not be indexed. Make sure this tag is not in use on pages that should be indexed. **Noindex not used.**

6. Title Tags

- Does each page have a *unique title tag*? Duplicate titles found in obituaries.
- Is the primary keyword phrase at the beginning or near the beginning of the title tag? This is typically a ranking boost. Yes
- Are there any title tags over approximately 70 characters long? 131 page titles of obituaries found over 70 characters long.
- Do the title tags appear to be spammy, or keyword stuffed? This can reduce *click through rates* in search results and result in lower ranking. No

7. Are images SEO optimized?

- Use of keywords in file name? Yes
- Use of keywords in **img alt** text? Yes
- Do pages that are dedicated to images, like a Gallery, have appropriate title tags to help describe the image? Yes

For detailed image optimization recommendations, see [Six Steps to Quickly and Expertly Optimize Your Site's Images](#).

8. Text Formatting

- Are H tags (h1/h2/h3) in use?
H1, H2, and H3 used.
- Does the site use more than one H1 tag per page? It shouldn't, unless you're working with a Blog where individual post sections are marked with h1 tags for each post title in Categories, Blog Home, etc. 2 Pages with multiple H1.
- Is content formatted well and easy to read? Yes

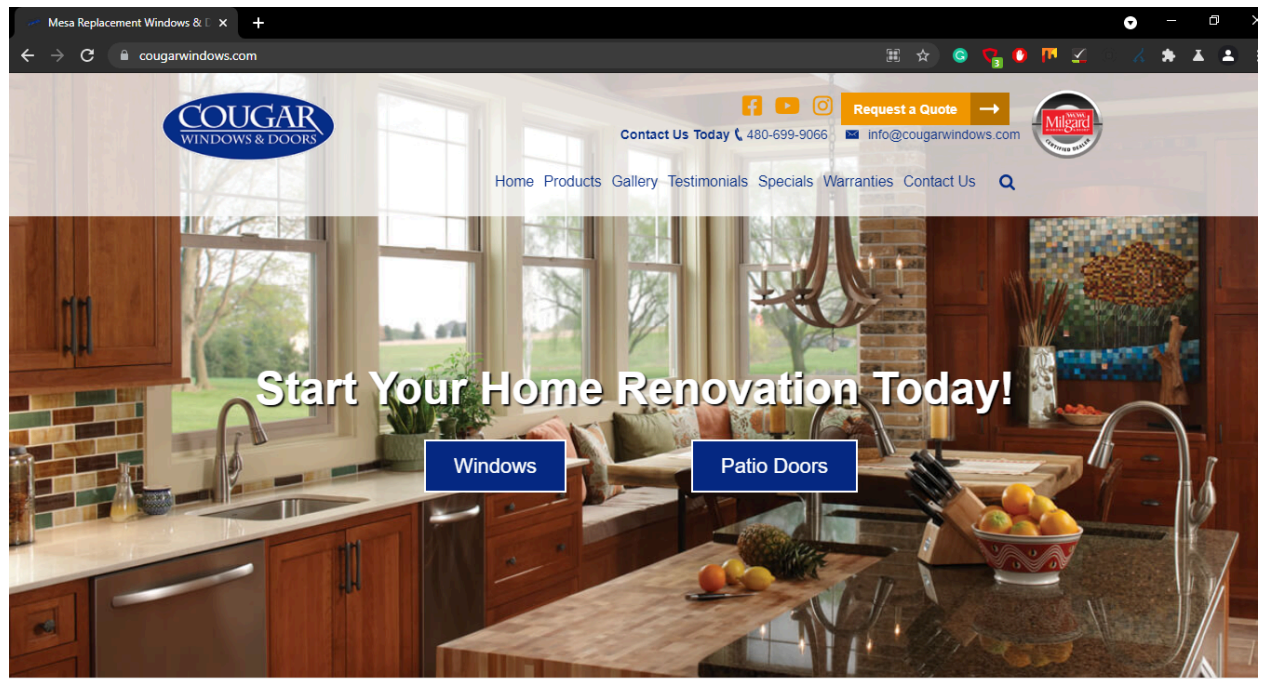

9. Advertising

- How many ad blocks are in use throughout the site? none
- What approximate percentage is the ad to content ratio in regards to screen real estate? N/a
- Is over 50% of the above the fold content composed of ads? N/a

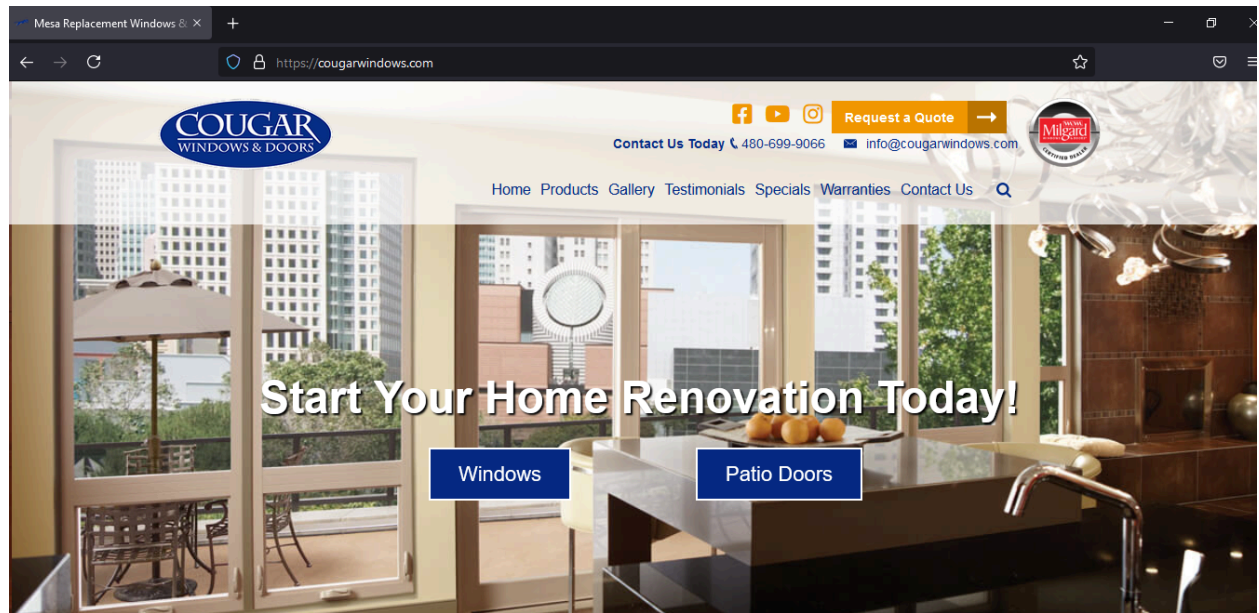

10. Desktop Compatibility

- Review site using current and older versions of Edge/Internet Explorer, Chrome and Firefox. Check for variations, problems rendering pages, layout variations and using features such as navigation.

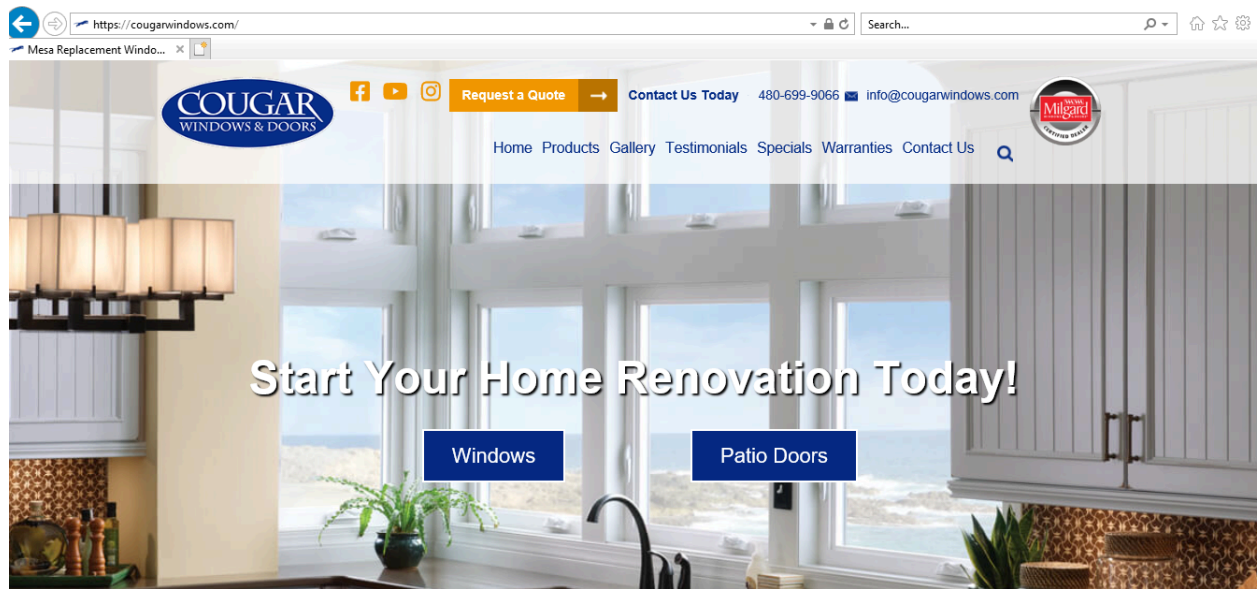

Chrome: OK

Firefox: OK

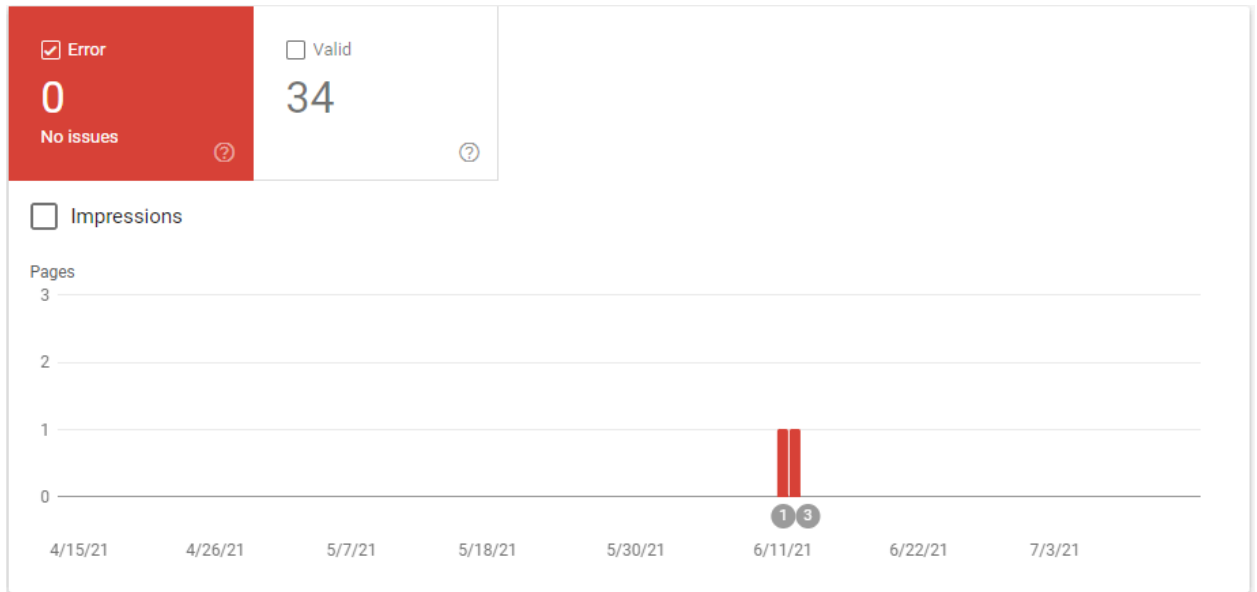

Internet Explorer: OK

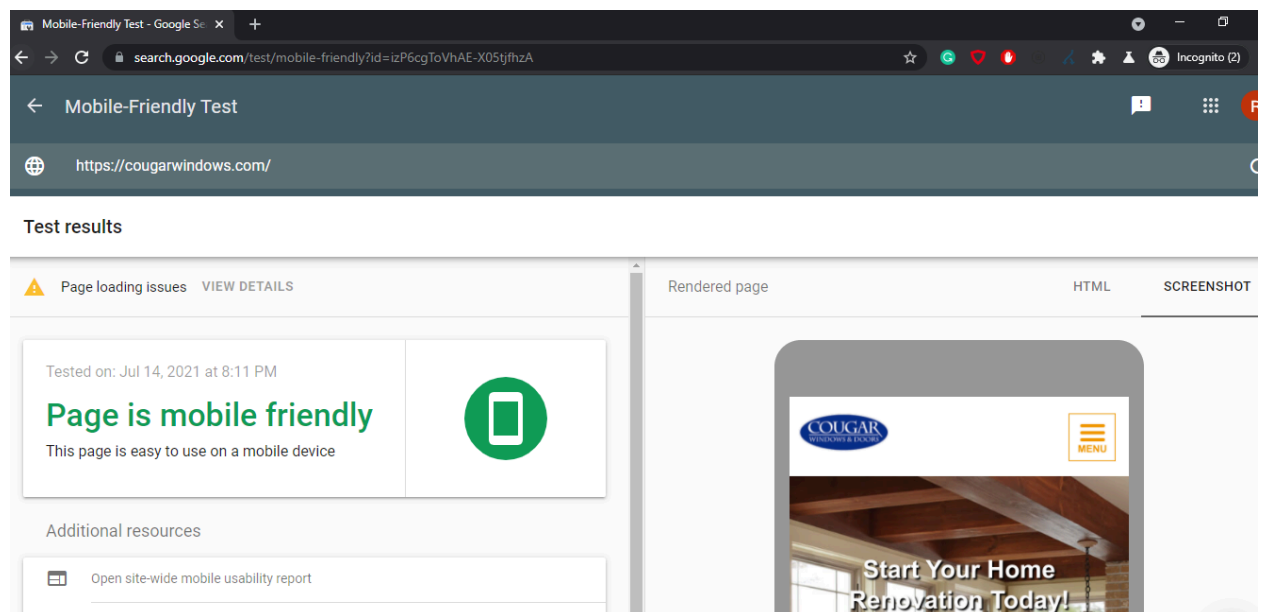

11. Mobile / Tablet Compatibility

- Check the GSC Enhancements **Mobile Usability** report for errors.

- GSC expects pages to load very fast, and if your server is a bit slow the rendering test Google does may not have time to load the CSS or JS files it needs to render a page correctly. If the page doesn't really have any errors, often just submitting them for validation will be all you have to do to resolve errors in this section. **No errors found**
- Google's [Mobile Friendly Test](#) is also very helpful when diagnosing what might be wrong. If your pages "should" be mobile friendly, the majority of errors you'll likely see is due to Google not being able to load the CSS & JS the page needs to render properly.

Do not be concerned about resources that are not on your site that are blocked for

things like Social Plugin's, Tracking Scripts, Ad Networks, etc. **Your goal is for Google to have access to everything that is necessary to render the page correctly.**

- When using a Smartphone, can you find the address, email contact and phone number? **Yes**

[Home](#) » [Contact Us](#)

Call us any time for a free consultation, [\(480\) 699-9066](tel:480-699-9066)

- Can you use the site's main navigation links? **Yes. Navigation is useable**

- If there are videos present, can you view them on the Smartphone? **No.**
- Dedicated Mobile / AKA "M Dot" sites such as m.facebook.com are sites that are made specifically to fit smartphones, but do not adapt to fit desktop browsers. Typically they are used in conjunction with a desktop site, which redirects mobile users to the mobile site.
- Mobile visitors to your desktop site should be redirected to the same content on your mobile site. If there is no appropriate page on the mobile site, the visitor should not be redirected.

No mobile version

- Per Google's recommendation, your desktop pages should have a **rel="alternate"** tag that links to the Mobile equivalent of the page.

No mobile version

- Your Mobile site should have **rel=canonical** tags pointing back to the equivalent desktop version of that page.

No mobile version

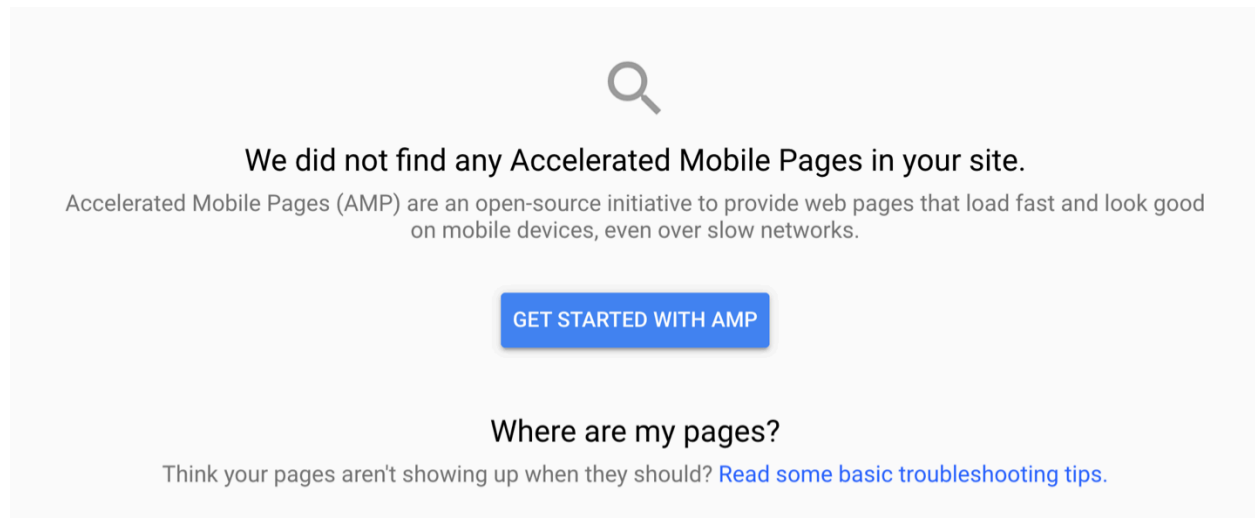

- If you have your mobile site on one domain or subdomain (m.example.com) and your desktop site on another domain (www.example.com), each site should have their own XML Sitemap. **N/a**

- Your M Dot domain should be verified separately with Google Search Console so that you can submit the sitemaps independently. N/a
- If your mobile site is a subdirectory of your main site, (www.example.com/mobile) you would only use one sitemap for both mobile and desktop pages. N/a
- Verify the dedicated Mobile site can be spidered and content is not blocked in robots.txt. Many of these sites were setup in the past to block access to spiders via robots.txt or meta no-index tags. Now that Google has a method using **rel=alternate** and **rel=canonical** blocking the robots is a BAD idea and can kill your mobile ranking. N/a

12. Accelerated Mobile pages

There are very specific requirements for AMP for both HTML code usage and for Schema Markup. Errors are very common for many WordPress plugins available at this point. If you're already working with an AMP enabled site, you certainly need to review the following **frequently** as Google keeps changing requirements.

Review Google's Search Console AMP Report

- Log into Google's Search Console and review their Enhancements **Accelerated Mobile Pages** Report. Since AMP is still somewhat new, many errors are likely going to require frequent updates to Plugins in order to stay ahead of Google's requirements and general errors (assuming you're using WordPress or another CMS). **Accelerated mobile pages in site not found.**
- If you need help figuring out how to fix validation errors, this guide may be helpful with your testing - [AMP Project Validation](#). For Schema.org markup errors, use the [Google structured data testing tool](#).

Check for AMP Rel Canonical Tagging

In order for Google to understand the correlation between your normal HTML pages, and your AMP HTML pages, you'll need a set of tags on each page.

```
<link rel="canonical" href="https://domain.com/std-html-page.html">
```

- The AMP pages should ALL have a **rel=canonical** tag, even if there isn't a companion regular HTML page. **N/a**
- Each AMP page should link to its standard HTML version, or if there is none, it should self-reference. **N/a**

Check for rel="amphtml" Tags

Correspondingly, your regular HTML pages should include **rel=amphtml** tags to connect to their AMP version.

```
<link rel="amphtml" href="https://domain.com/AMP-page.html">
```

- Your regular HTML pages should ALL have a **rel=amphtml** tag that points to its AMP version if one is available. **N/a**

13. Is there Structured Data Markup in use?

- Is the markup properly formatted? The GSC Enhancements Report will show site wide markup warnings and errors.
- Sample some representative pages using Google's Structured Data Testing Tool at <https://search.google.com/structured-data/testing-tool>.

Organization Schema Used.

Local Business Schema

Website Schema

Service Schema

Note what formats (JSON/LD, Microformats, Hcard, etc.) are in use. Excessive errors can result in Google penalties.

- Check for errors in markup such as incorrect hours, business name, logo, address or phone (NAP) when compared to visible content on the page. Markup needs to match corresponding visible text. **No warnings detected.**

14. Are Facebook Open Graph Tags in use?

- Are Facebook Social Buttons in use? Home page only? Site wide? **No**
- Test the page's Open Graph tags using [Facebook's Lint Tester](#) and look for errors.

Time Scraped	July 10 at 4:15 AM	Scrape Again
Response Code	206	
Fetches URL	https://www.cougarwindows.com/	
Canonical URL	https://cougarwindows.com/ 109 likes, shares and comments (More Info)	
Redirect Path	Input URL → https://www.cougarwindows.com/ 301 HTTP Redirect → https://cougarwindows.com/	
Link Preview	 COUGARWINDOWS.COM Mesa Replacement Windows & Doors Cougar Windows & Doors In Need of Windows & Doors Products? Call Cougar Windows & Doors – Your No. 1 Choice For Premium Quality Replacement Windows & Doors in Mesa, AZ.	

- Is the content within the tags unique on each page and formatted correctly? **The og tags are not implemented.**
- Are the same Open Graph tags used site wide, or do they correctly reference each page uniquely? **No, OG Tags not used sitewide.**
- Are Social Buttons properly referencing the URL where the button is at? Or do they have all the buttons referencing the home page, or their Facebook page? **Yes**

15. Canonical Issues

- Is the **rel=canonical** tag in use on the site? If so, is it being used correctly? **Yes, Canonicals used.**
- Does the *internal linking structure* agree with your canonical version of the site that is preferred? Otherwise, if you prefer to use www.domain.com instead of domain.com, do the links within the site use the www for example <http://www.domain.com/>? **N/A**
- Remember other content formats, such as .PDF, .DOC, Video, etc. – All content should be using the same canonical version of the domain name.

16. Multilingual Sites

- Does the site have unique content to target multiple languages and/or country locations? **No**
- If so, is the **hreflang** tag in use on the site? Is it being used correctly? **N/a**

17. Are iframes or frames in use?

● Both iframes and regular frames are bad for ranking. Check to make sure the use of these methods are limited and not used to show any major portions of content. Iframe tags are quite common, such as the Facebook Like button, but should be avoided for content that needs to be indexed. **Iframe found.**

```
class=textwidget><p><iframe
style="border: 0;" src="https://www.google.com/maps/embed?pb=!1m18!1m12!1m3!1d3330.277777496092!2d-111.75084558448393!3d33.41600

height=0 width=0 style=display:none;visibility:hidden></iframe></noscript><div
```

18. Is JavaScript or Ajax used to generate content, or used excessively?

Javascript used to generate content.

- Search engines typically have a problem reading JavaScript and in general, you should not expect *JavaScript generated content* to be indexed, or usable by a search engine.
- Ajax generated content can be problematic, not impossible, but certainly can be difficult to get indexed.

19. Content Date

- Is the creation date listed in the content? Last Updated Date? These are quality signals according to Google. Even on older, evergreen content Google likes to see the content date published on the page. **Dates found on content.**
- Is the Copyright Year in the footer of the site up to date? **Yes**

© 2021 Cougar Windows & Doors. All rights reserved.

20. Your Money or Your Life Requirements

YMYL (Your money or your life) type sites such as those that deal with financial, shopping, medical, legal and safety information have very high quality standards requirements by Google. They should typically have these content pages as described by Google's Quality Raters Guidelines.

- Privacy Policy. **No.**
- Terms of Service. **No.**

- Robust and Complete Customer Service and/or Contact pages. **Yes.**
- Functioning Order Forms. **Yes.**
- About Us/Company Info - these are typical pages on a legitimate business website. **Yes**
- HTTPS is highly recommended for YMYL content. **HTTPS**

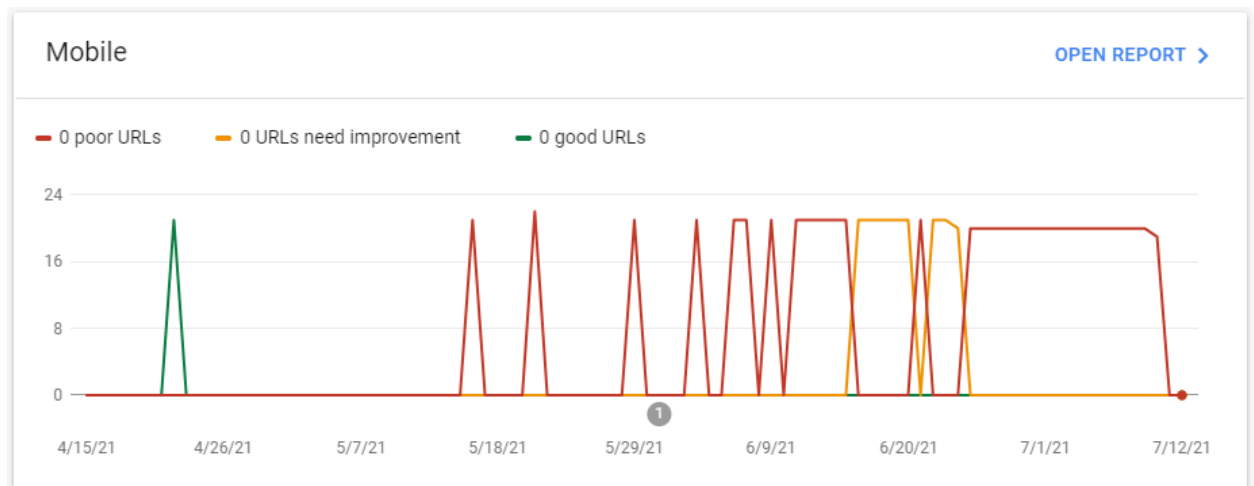

Load Time

1. Page Speed Google Search Console

- Review the GSC Enhancements **Speed** section and observe what results Google has.

Desktop:

0 Slow URLs | 0 Moderate URLs | 0 Fast URLs

Desktop

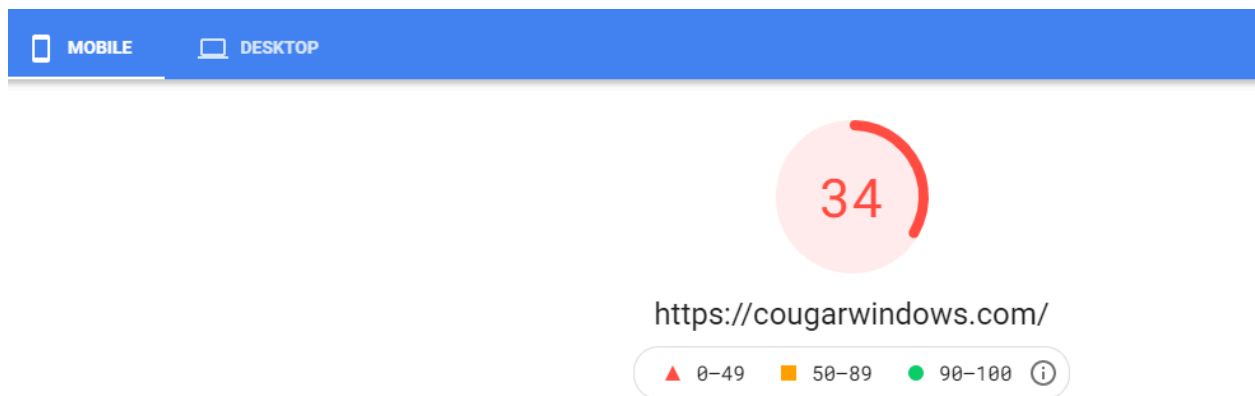

OPEN REPORT >

Not enough data for this device type. [Learn more](#)
[Try PageSpeed Insights](#)

2. Google Page Speed Insights

- You should audit pages that represent the different layouts and/or templates that are in use on the site such as the Home Page, Product Page, Blog Post, etc. Ideally test at least one URL that represents that part of the site with Google's [Page Speed Insights](#). Record Mobile and Desktop Ratings.

Mobile: 34/100

Desktop: 79/100

https://cougarwindows.com/

▲ 0-49 ■ 50-89 ● 90-100 ⓘ

- At the minimum your site should score better than your competition's site, ideally your site should score in the 80-100 range for both desktop and mobile tests if possible.
- Note that Google Page Speed Tests rely on Chrome Browser users traffic data to get a report on actual page speed. Unfortunately sites that are low traffic will not likely see the Field Data speed result. Higher traffic sites should see a report showing both the FCP (First Contentful Paint) and FID (First Input Delay) speed results.

Mobile:

Field Data — The Chrome User Experience Report [does not have sufficient real-world speed data](#) for this page.

Origin Summary — The Chrome User Experience Report [does not have sufficient real-world speed data](#) for this origin.

Lab Data

■ First Contentful Paint	1.9 s	▲ Time to Interactive	11.6 s
■ Speed Index	5.3 s	▲ Total Blocking Time	730 ms
▲ Largest Contentful Paint ■	5.4 s	▲ Cumulative Layout Shift ■	1.7

Desktop:

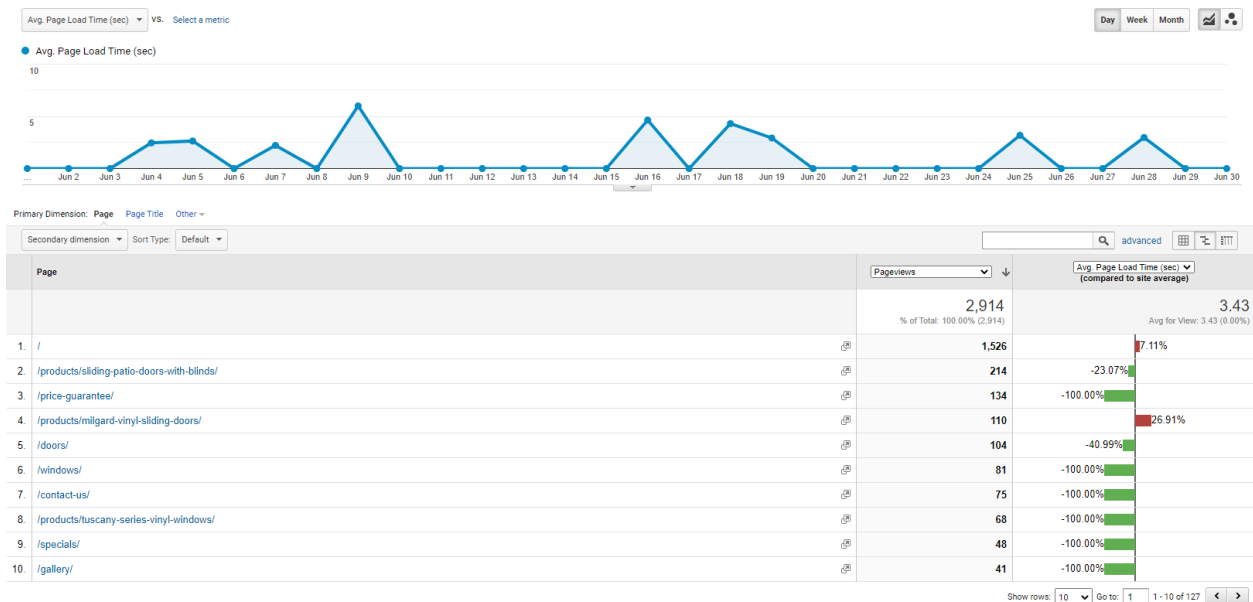

Field Data — The Chrome User Experience Report **does not have sufficient real-world speed data** for this page.

Origin Summary — The Chrome User Experience Report **does not have sufficient real-world speed data** for this origin.

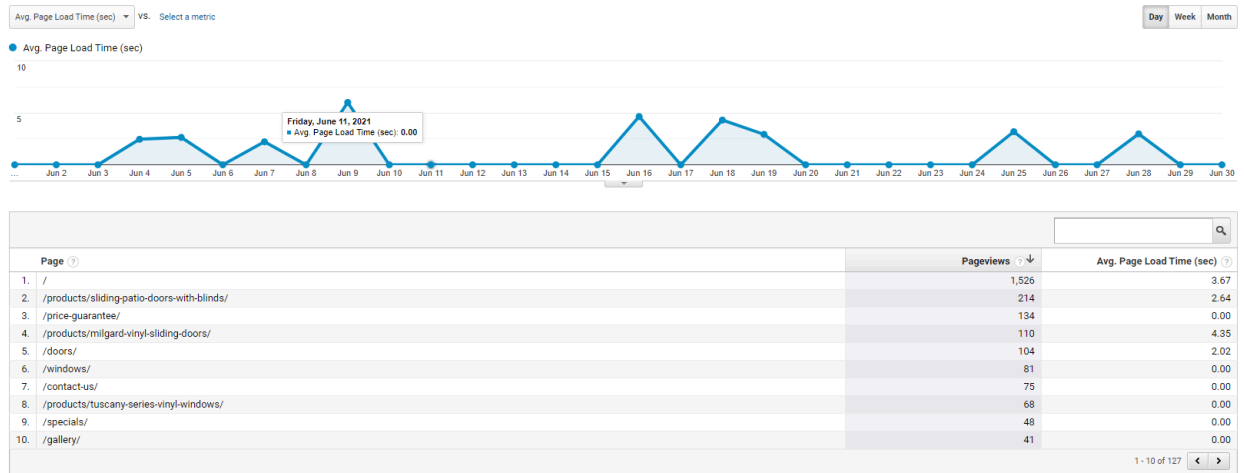

Lab Data

● First Contentful Paint	0.5 s	● Time to Interactive	0.5 s
● Speed Index	1.1 s	● Total Blocking Time	0 ms
■ Largest Contentful Paint	1.6 s	▲ Cumulative Layout Shift	1.485

- If the site is using Google Analytics, review the **Behavior > Site Speed** reports. The **Page Timings** section can be sorted by **Avg. Page Load Time** showing you the slowest pages on the site. Additionally you can show in the 2nd column the page Bounce Rate. Not enough data.

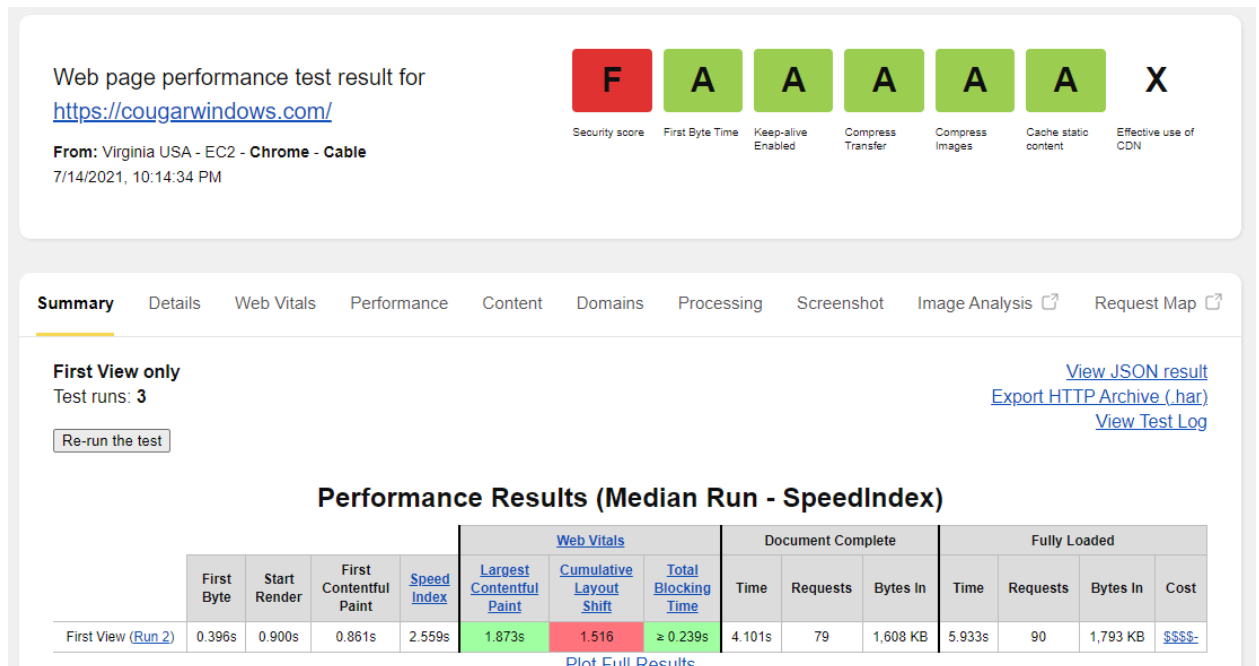

- Next in the Google Analytics Site Speed section, the **Speed Suggestions** report will display pages that are ranked by page views.

3. Test Website Response Time

We recommend using [WebPageTest.org](https://www.webpagetest.org) for performance benchmarks, it's a fast and a well-accepted service to analyze load time.

- Note the Grade (A through F) reported in each section, First Byte Time, Keep-alive, Compressed Transfer, Compressed Images, Progressive Images and Caching.

Each section should be scoring an "A" on an optimized web page. Again, test more than just the home page. It's important to test major sections of the site. Ideally each

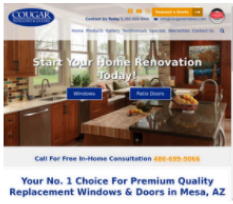

time your site template makes a change (product, home, category, gallery, FAQ, etc.) you should test for irregularities.

- Specifically note pages with high *Time to First Byte* (TTFB), these are pages that may have backend problems, hosting issues, DNS issues, etc. that need resolving. Slow TTFB pages are VERY aggravating for users, and have been suspected of having an impact in search ranking as a site quality factor. Ideally we would like to see a TTFB below .200 ms if possible.

4. DNS Server Tests

- DNS errors can cause severe performance problems, you can test yours for free at dnscheck.pingdom.com.

Your Results:

[DOWNLOAD HAR](#) [SHARE RESULT](#)

Performance grade

Improve page performance

GRADE	SUGGESTION
F 0	Make fewer HTTP requests
F 0	Use cookie-free domains
F 0	Add Expires headers
F 40	Reduce DNS lookups
F 45	Compress components with gzip
A 100	Avoid empty src or href
A 100	Put JavaScript at bottom

See **How the Pros Engineer a Lightning Fast Website** - [Part 1](#) and [Part 2](#) for tips on improving these numbers.

Local Search

1. Does the business have an *Owner Verified Google My Business Page*?

- Is there more than one My Business Page Listing for the business? **No**
- Who is in control of the account via the listed email address? **RRM**
- Is there a correct link to their website? **Yes**

2. External Citations and Reviews

- Do external citations include keyword stuffed references describing the business such as "best plumber in Houston"? Would an editor from Google use the words in a description? **External citations reference the brand/company name**
- Are reviews duplicated in multiple locations? Does the website publish their Yelp, Google My Business Page, or other duplicate reviews on the site? This can cause a loss of reviews in Places when Google finds duplicates. **No duplicate reviews found on other local citation sources.**
- Are on-site reviews or ratings marked up with Schema.org/Review tags? **Yes**
- Note the last review or ratings date, are new ones being posted? **Yes**

3. Do Address & Phone Number on the Google My Business Page and website match exactly?

Yes

- This is a factor in Local Search for Google.

4. Are City and State, and/or other location related Keywords in use within H tags and Body Text?

No

- Use of the City and State as keywords can improve Local and Organic Search Ranking.
- A clearly visible business address and contact information is also a good site quality sign.

5. Are the Business Name, Address, Phone and Contact info listed on every page?

Yes

Business Contact info (NAP) on every page is highly recommended both from Google Quality Raters Guideline and from a local search aspect.

Secure Server Errors / HTTPS

This is a ranking factor at Google, so in almost all cases your site should be entirely HTTPS. It should also be free from security errors, so make sure to check the following. **Website uses HTTPS**

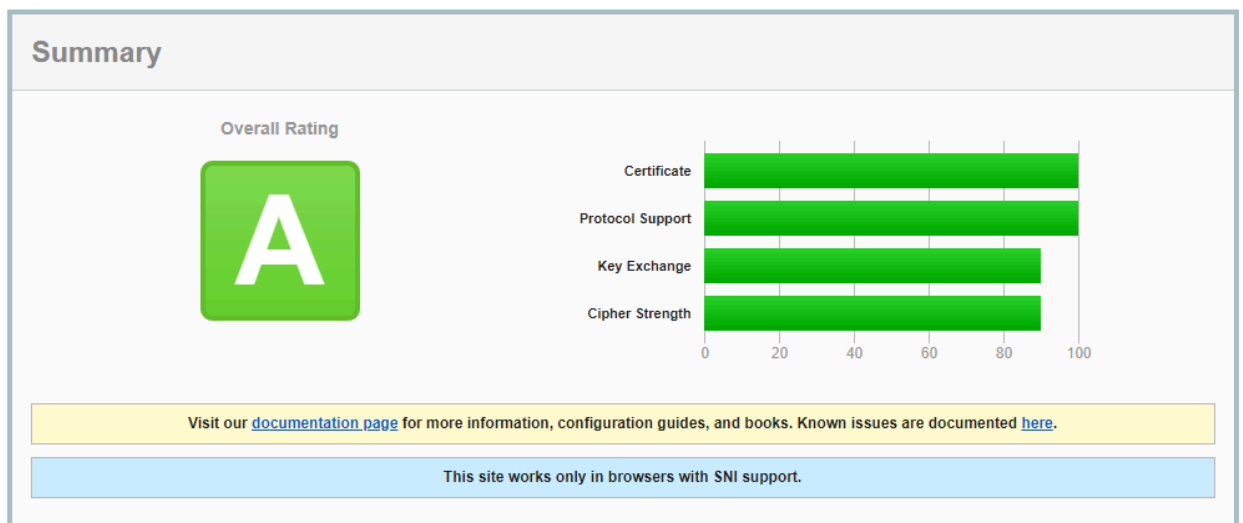

1. Inspect the padlock icon in the browser

- Does the padlock icon show an X, circle with an "I" in it, slash or red label indicating the certificate is invalid? **None**
- Are there any browser security warnings when you load the page? **None**
- If the padlock icon isn't showing, are there any mixed content errors or other errors being reported? **None**

2. Test the Site Certificate using [Qualys SSL Labs Server Test](#)

Certificate #1: RSA 2048 bits (SHA256withRSA)	
 Server Key and Certificate #1 	
Subject	cougarwindows.com Fingerprint: SHA256: 85a7ca8bf272cd881odd1d8e30987872cc3c2915bd7e5c5431e15ffc136d23c0 Pin SHA256: 8oaNINDTY42EkytPt5s/LHi9vegJ+QT2ZYdwqj8Xs=
Common names	cougarwindows.com
Alternative names	cougarwindows.com www.cougarwindows.com
Serial Number	00d12194eac76f39f2
Valid from	Thu, 15 Apr 2021 11:59:07 UTC
Valid until	Tue, 17 May 2022 11:59:07 UTC (expires in 10 months and 2 days)
Key	RSA 2048 bits (e 65537)
Weak key (Debian)	No
Issuer	Go Daddy Secure Certificate Authority - G2 AIA: http://certificates.godaddy.com/repository/gdig2.crt
Signature algorithm	SHA256withRSA
Extended Validation	No
Revocation information	CRL, OCSP CRL: http://crl.godaddy.com/gdig2s1-2871.crl OCSP: http://ocsp.godaddy.com/
Revocation status	Good (not revoked)
DNS CAA	No (more info)
Trusted	Yes Mozilla Apple Android Java Windows

- Does the summary report show at least a "C" Overall Rating? If not, there are issue that need resolved. **Overall A**

- Does the Configuration support TLS 1.2, TLS 1.1 and TLS 1.0? These are the suggested protocols to be using at this time. **Supports TLS 1.3, 1.2**

Configuration

Protocols	
TLS 1.3	No
TLS 1.2	Yes*
TLS 1.1	No
TLS 1.0	No
SSL 3	No
SSL 2	No

(*) Experimental: Server negotiated using No-SNI

- In the Authentication Section, when does the certificate expire? **Tue, 17 May 2022 11:59:07 UTC**
- In the Authentication Section, does the cert use SHA2 or SHA-256withRSA? That's what Google recommends, SHA-1 will soon be out of date. **SHA256withRSA**
- Does the Authentication Key show RSA 2048 bit? If not the cert should be upgraded. **RSA 2048 bits**

3. Are there unintentional insecure URLs indexed?

- If you do a site:domain.com search at Google, are you finding any HTTP URLs indexed? **No**
- Are both HTTP and HTTPS versions of the site getting indexed? **HTTPS version only**
- Test the server redirect from http to https using SEN's [HTTP Header Analyzer](#), the redirect should generate a 301 code from http:// to https://. **301 code**

4. Are internal links correct?

- Do the pages rel=canonical tags point to the correct HTTPS version of the URL?
Does use canonical

```
name=description content="In Need of Windows & Doors Products? Call  
rel=canonical href=https://cougarwindows.com/ ><meta
```

General

>>> Last update of WHOIS database: 2021-07-14T15:23:20Z <<<

- Is *whois domain registration* information public? **Public**
- Note renewal date for domain. Who is the contact that will be renewing the domain?
Are they aware of what to do when it's time for renewal? **2023-03-27T19:24:43Z**

2. Google Analytics

Many websites make use of Google Analytics, but also many have things configured incorrectly. Do a quick review of the following;

- **GA implemented via Google Tag Manager**
Log into the Google Analytics account and verify the account is properly tracking hits to the site. You should be able to go to the real time traffic display, load a page and see the traffic as a hit in real time.

- Verify only one instance of the same Google Analytics Tracking Script is being used on each page. Multiple instances of the tracking code can inflate site traffic. **No**

```
j=d.createElement(s),dl=l!='dataLayer'?'&l='+l:'';j.async=true;j.src='https://www.googletagmanager.com/gtm.js?id='+i+dl;f.parentNode.insertBefore(j,f);
})(window,document,'script','dataLayer','GTM-MFD2WTJ');</script> <script type=application/ld+json>{
```

- Is Google Search Console associated with the Google Analytics account? **No**
- Is the Google Analytics setup making use of demographics, events, goals and conversion tracking? **Goals**

+ NEW GOAL Import from Gallery Search					
☐	Goal	Id	Type	Past 7 day conversions	Recording
☐	Phone Clicks	Goal ID 2 / Goal Set 1	Event	9	☒
☐	Thank You Page	Goal ID 1 / Goal Set 1	Destination	5	☒

Show rows 10 1 - 2 of 2 < >

- Is the account setup for the proper protocol that the website is using (HTTP/HTTPS) ? **HTTPS**

Tracking Id

UA-104045658-1

Property Name

Cougar windows

Default URL

http:// ▼ www.cougarwindows.com

3. Dangerous Remote Resources

- Look for remote website references for Javascript, fonts, and other resources. Do you recognize the domain names for things such as jquery.js? Are there multiple calls for the same resource? Look for off site scripting such as

```
<script type="text/Javascript" src="http://www.odd-domain.org/jquery.js">
```

If you don't recognize the domain name, this could be a potential source of malware or viruses. It may or may not be active when you test it! If you get zero information back from one of those, it could very likely be that the site has been hacked in the past, but the dangerous code hasn't been activated... yet. A call to a blank resource is a good indication of a trojan horse that can be activated at any time!

- Hosted libraries such as ajax.googleapis.com are a safe resource. If in doubt, do some research to make sure that off site resource is safe.

```

<script src="/Scripts/client.js" type="text/javascript"></script>
<script src="/DependencyHandler.axd/933ccd7405a57eb3b497d41758367904.513.js" type="text/javascript"></script>
<script type="text/javascript">
    AC_FL_RunContent = 0;
    $("html").addClass($.browser.name).addClass("version-" + $.browser.versionNumber);

    if ($.browser.name === 'msie') {
        $('#msie-banner').css("display", "block");
        setTimeout(function(){ $('#msie-banner').fadeOut(1000); }, 5000);
    }

    FrazerMaps.Init({ apiKey: "AIzaSyAJepqBp8IkgD-XlWaEODqqSpEKUFicbVow" });
</script>

<script type="text/javascript">
    $(function () { DynamicForms.setDomainId('content$empty_root$$p__nhibernate$__$guid$_ef594654fa464ba9a0d88327fba5b292'); });
</script>

```

Be especially vigilant if you know the site has been hacked or compromised in some way in the past. **No harmful javascript code found.**

4. CMS / WordPress Software Out of Date

- Log into the sites CMS and review the current CMS release date. Is there a notification there is a newer version available? How many versions is the software out of date? Google is now sending warnings to verified sites when it detects WordPress sites need to be updated. This **may be quality signal for Google**, as out of date software is often a security risk. Note: Web Hosts may shut down a site that is allowed to get too far out of date due to security risks. **N/A**
- Review the sites plugins to see if any need updated. **N/A**
- Don't underestimate the potential for errors or compatibility problems when updating a website's CMS, Plugins or Themes. Make certain you have a FULL working backup of the sites files and database/s before an update, and make sure you have a contingency plan should an update cause major issues or make it totally unusable.

5. Video Testing

- Verify no flash is used for navigation, videos or other elements on mobile pages. HTML5 is preferred for video players, or embed a popular service for video such as YouTube or Vimeo. Google has been applying ranking demotions for some sites due to the use of Flash in mobile search since 2013. Google may generate a **"Uses Flash. May not work on your device. Try anyway | Learn more"** notice to users in the search results to warn users of incompatible sites. **No flash used.**

- Verify all videos are responsive so they scale to fit the screen, even if you're using an embedded video such as YouTube. **Well embedded.**

6. User Interface Testing

- Be sure navigation is different devices on each device. 30-pixel margin around links is considered minimal for touch targets.

Yes, it is usable

- Review any pop-ups used on pages that can be reached with mobile or tablet devices. Be sure the user can escape or close the pop-up easily on all devices.

No pop-ups

RESS Sites

RESS (Responsive Design with Server Side Components) are sites that are dynamically generated and typically change the template based on user-agent and/or device width. The site may or may not alter the page content based on the device, but **if you do change content based on device, you should be sure you're using the Vary:User-Agent header or Google may think you are cloaking the page and apply a penalty!**

One older example of RESS is the WordPress Plugin's that load a mobile template when the plugin detects a mobile user. Those plugins need to also be treated as an RESS enabled site, even though the content does not change.

1. Test for Vary: User-Agent HTTP Header

- Google requires that sites that change content based on user agent notify them by using the **Vary-HTTP Server** Header as listed on their [Dynamic Serving](#) page.

Vary: Accept-Encoding found

Requesting <https://cougarwindows.com/>

HTTP/1.1 200 OK

Date: Wed, 14 Jul 2021 15:56:58 GMT
Server: Apache
Upgrade: h2,h2c
Connection: Upgrade
Last-Modified: Wed, 14 Jul 2021 14:34:01 GMT
ETag: "afcc-5c7163ed9ba07"
Accept-Ranges: bytes
Content-Length: 45004
Vary: Accept-Encoding,User-Agent
Referrer-Policy:
Content-Type: text/html; charset=UTF-8

- You should also use this header if you're hiding content based on device, such as using CSS **display:none** for mobile users. That is a risky thing to do if the content is not viewable in any situation by the mobile user. Be aware that Google has stated they may "discount" or ignore text that makes use of CSS **display:none** or **visibility:hidden** text. If the user can display the text easily by activating a toggle or similar feature, that use is ok. The problem is with hidden text that the user will never see.
